

Body Modification: Putrefaction Accelerator (1:30h-5h)

- Injection of enzymes to blood circulation system during the dying process, therefore accelerating the putrefaction of human corpse.
- This body modification allows the non-genetically modified or unparasitized human body to become extremely perishable after losing the immune system.
- The effect of accelerated putrefaction goes directly into decomposition. The amplified stench from the quickly accumulated rotten meat alienate the self (body) to our same kinds (humans), while it draws species other than human (decomposers).
 - Corpse would lose the most immortality and worth being monumented by something forever. The fast-losing body immaterialized the non-existing soul/spirit. By then, humans treat corpse of the same kind as the unrefrigerated tuna and herring in early fishing era.

_____ -

The “Petrifaction Accelerator” can be worn, but very dangerous to be interactive.

Description:

This body modification is light weight and can be easily carried on four limbs and along vertebrate. The mechanism is wired and does not have remote control,

Materials needed:

[Wired] Gaseous and hydraulic systems:

- Syringes (for enzyme injection)

- Co2 cartridges (powering the syringe injection)

[Wired] Electric signal system:

- Blood-oxygen examination/ heart beat detector
- safety

[not wired]

- support structure (exoskeleton)

- Heartbeat detector (for activating the system)
- A safety
